Aurora Confinement – Master Context, Customer Outreach and LOI Source of Truth

Internal working document. Not for external circulation without review.
Last updated: 27 October 2026
Document owner: Etienne Rasmus Gras
Principal source: Aurora Confinement 27_10_2026
https://docs.google.com/document/d/1H0EBjMDO3lZyTxgnbnBMNtwIsAGOIBqODWI1JGDfxic
Revision log: Version 1 - initial master skeleton populated from the principal source document, team information supplied by Aurora, and Nordic Fusion Forum 2026 expressions of interest.

1. Purpose and instructions

This is Aurora Confinement's internal source of truth. It is designed to brief the team and future AI-assisted work without repeatedly reconstructing the company context.
Use it to prepare customer-specific emails, six-slide pitch decks, discovery interviews, pilot proposals, non-binding LOIs, the initial DKK 100,000 soft-funding application and a subsequent Innobooster application.
Content status labels used in this document:

- Verified external fact — supported by a visible primary or authoritative source URL.
- Aurora-supplied fact — supplied by the founder or team but not independently verified.
- Internal calculation — arithmetic based on disclosed assumptions.
- Engineering estimate — preliminary and subject to prototype, supplier and safety validation.
- Customer hypothesis — a proposition that must be tested in interviews or pilots.
- Pricing hypothesis — an unvalidated proposed price or package.
- Non-binding expression of interest — early interest, not an LOI, customer or revenue.
- Unknown — requires team input.

Privacy rule: personal email addresses, submission IDs and unnecessary personal information from the screenshots are excluded from the main narrative. They may only be stored in a restricted internal pipeline and must never be copied into external decks.
External-claims rule: every external factual or numerical claim must retain its exact full visible URL immediately after the supported statement.

2. Team-workday completion dashboard

The six highest-priority decisions for the team workday are Product B's actual technical status; the minimum viable prototype; safety and operating requirements; the priority customer segment; the pilot and LOI offer; and team roles, availability and ownership.

Section	Status	Most	Owner	Action	Deadline

		important missing information		**required**	
Product B technical status	Partly known	What physically exists and what has been tested	Technical lead TBD	Create evidence inventory	28 Oct 2026
Minimum viable prototype	Unknown	Binary milestone deliverable within DKK 100,000	Core technical team	Freeze MVP scope	28 Oct 2026
Safety and operation	Partly known	RF, electrical, magnetic, glass, heat and operator requirements	Safety owner TBD	Draft hazard and compliance map	Owner/date to assign
Priority customers	Partly known	First three segments and named buyer roles	Commercial team	Select segment priorities	28 Oct 2026
Pilot and LOI offer	Partly known	What Aurora offers and what conditions an LOI records	Etienne + team	Select two offers and approve request	28 Oct 2026
Team commitments	Unknown	Roles, hours, deliverables, IP and external-name permission	Etienne	Complete commitment sheet	28 Oct 2026
Target-account pipeline	Unknown	Thirty named Nordic and European accounts	Commercial team	Build and assign account list	Owner/date to assign
Funding plan	Partly known	Funding programme, eligibility, final allocation and deadline	Etienne	Confirm programme and budget	28 Oct 2026

Suggested workday sequence

1. Confirm the product definitions and Product B pre-seed focus.
2. Establish Product B's actual technical state.
3. Define the minimum viable Product B prototype.
4. Assign formal team roles, availability and ownership.
5. Select the first three customer segments.
6. Define the pilot and LOI offer.
7. Select 30 initial target accounts.
8. Assign outreach owners.
9. Confirm the DKK 100,000 allocation.
10. Set deadlines and the next review date.

3. Executive summary

Aurora Confinement is making plasma and fusion tangible through accessible educational and exhibition technology.

The immediate pre-seed focus is Product B: a proposed table-sized institutional system designed to display real, visible plasma for exhibitions, introductory education and stakeholder engagement.

Initial target organisations include science museums, science centres, universities, fusion companies, laboratories, energy organisations, visitor centres and selected public exhibitions.

Aurora is seeking DKK 100,000 in non-dilutive soft funding. The proposed purpose is prototype development, technical and safety clarification, customer validation, company establishment and preparation for a subsequent Innobooster application.

Product A is a supporting static educational and desk model. Product C is a longer-term research-platform ambition and is outside the immediate pre-seed case.
Product B is not a fusion reactor. It does not produce net energy or demonstrate commercial fusion viability. It may support plasma literacy, public familiarity and informed engagement, but Aurora must not claim that one exhibit creates public confidence or social acceptance.

Question: What is Aurora's final one-sentence mission?
Engineering technologies and experiences that democratize fusion energy.

Question: What is the final 30-second elevator pitch?
Fusion could become a low-carbon, stable source of energy, but it remains abstract and difficult for people and decision-makers to understand. Aurora Confinement is developing Product B: a table-sized system displaying real, visible plasma for museums, universities, fusion companies and public exhibitions. By making fusion tangible and communicating both

its potential and limitations, we support informed public engagement and confidence - helping create the foundation for credible national fusion strategies. Product B is our entry point toward Product C, a research platform.

Question: Which legal entity will apply for the initial funding, and what is the CVR establishment plan?
Etienne will apply for CVR, when we get granted 20.000, which is minimum investment to start ApS danish company

Question: Which DKK 100,000 funding programme is being targeted, and what are its eligibility rules and deadline?
We have a hard time finding funds that can grant 100.000 for student startups (commercial), that don't have a CVR number yet.

https://mikrolegat.ffefonden.dk/sog-stotte/mikrolegat-ansogning/ (15. Nov 2026) needs 4 min pitch video (these guys fund 30k dkk without APS and up to 60k dkk with APS)

https://ottobruunsfond.dk/ (1. Nov 2026) (these guy do 20k - 50k dkk)

https://virksomhedsguiden.dk/content/ydelser/do-you-want-to-scale-beyond-beta/29939cd2-8a52-47a8-9252-da8f25506aa3/ (opens 30. Nov 2026 - 6. Jan 2027)

Question: What exact technical milestone will the DKK 100,000 deliver?
A testable prototype of product B exhibition model

4. Authoritative product architecture

The product labels below are authoritative for this master document. External materials must not interchange them.

Product	Role	Primary customer/use	Internal price	Current status	Next proof
A — static FDM	Supporting education and outreach product	Schools, universities, professionals, gifts	DKK 995 + DKK 495 curriculum	Concept and preliminary cost model; physical status to confirm	Prototype evidence and limited preorders
B — real plasma	Immediate pre-seed focus	Museums, universities, fusion and energy organisations, exhibitions	DKK 149,995	Proposed institutional system; physical status to confirm	Integrated prototype, safety case and partner feedback
C —	Future	Universities,	Multi-million-	Long-term	Later go/no-

research platform	option; excluded from current round	laboratories and fusion startups	DKK programme	concept	go after Product B validation

Product A - static FDM educational and desk model

Aurora-supplied concept: a modular, multi-colour FDM stellarator model on an aluminium base, with no real plasma. Intended roles include tactile teaching, desk display, outreach, gifts and low-risk customer acquisition.
Pricing hypothesis: DKK 995 for the core model plus a possible DKK 495 digital curriculum add-on. The source document estimates approximately DKK 415 in unit cost, but VAT, customer-acquisition cost, returns and overhead require clarification.
Likely early audiences: upper-secondary schools, universities, fusion professionals, science enthusiasts and organisations seeking a scientific gift or outreach object. Private demand is a niche hypothesis, not a validated mass market.

Question: What physical Product A prototype exists, and what photographs or test units are available?
We haven't printed a prototype yet, but we are working on cad drawings. We will be able to make 25cm x 25cm x 25cm 4 colored FDM print in good quality of a point and teach stellarator and perhaps tokamak

Question: Will Product A remain active during the Product B pre-seed phase, and what maximum team time may it consume?
Yes, but we will fund the first couple of prototypes of product A out of our own pocket.

Product B - real-plasma exhibition and educational system

Immediate pre-seed focus. The design concept uses a sealed borosilicate-glass torus containing a noble gas, together with radio-frequency electronics, magnetic components, a protective enclosure, controls and safety interlocks.
Pricing hypothesis: DKK 149,995 per institutional unit.
Engineering estimate: approximately DKK 56,500 for BOM, assembly, domestic logistics and packaging, excluding R&D, certification, sales, warranty, service, overhead and founder time.
Primary intended uses: museum and science-centre exhibits, university demonstrations, fusion-company outreach, energy visitor centres, policy exhibitions and other institutional engagement.

[TEAM INPUT REQUIRED]
Question: What is Product B's current physical development stage?
Proposed owner: Technical lead to be confirmed
Evidence or decision required: Photographs, CAD, subsystem tests, purchased components and a written readiness assessment.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: Which claims about Product B may be made today, and which describe only the future design?
Proposed owner: Core technical team
Evidence or decision required: Approved technical-claims list.
Deadline: 28 October 2026 team workday

Product C - future research platform

Long-term concept: a substantially more complex experimental plasma and magnetic-confinement research platform. The principal source document estimates a prototype programme in the multi-million-DKK range.
Product C is excluded from the current DKK 100,000 funding case, Product B TAM/SAM/SOM and initial customer outreach. It may appear only as a clearly labelled long-term option.

Question: Should Product C remain visible in near-term external materials at all?
Yes, it should be known that it is our long term goal, but the first seeding round is to create a working prototype of B exhibition model.

5. Product B technical truth sheet

What is currently known

- Proposed table-sized institutional exhibition and educational system.
- Proposed sealed borosilicate-glass torus containing argon, neon or another selected noble gas.
- Proposed RF power electronics, magnetic components, protective enclosure, controls and safety interlocks.
- Preliminary physical scale in the source document: approximately 40–50 cm tabletop assembly.
- Preliminary BOM and assembly estimate: approximately DKK 56,500.
- Product B’s Production Times and Man-Hours Estimate remains incomplete.

Technical fields requiring confirmation

[TEAM INPUT REQUIRED]
Question: Does a complete Product B prototype exist? If not, what is the most advanced assembled subsystem?
Proposed owner: Core technical team
Evidence or decision required: Photographs, videos, drawings, test logs and named responsible engineer.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What are the final target dimensions, weight and transport configuration?
Proposed owner: Mechanical lead

Evidence or decision required: Dimensioned drawing and transport concept.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What power supply, maximum power draw and electrical connection are required?
Proposed owner: Electrical lead
Evidence or decision required: Electrical block diagram and preliminary load estimate.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: Which plasma gas, pressure, vessel specification and consumables are required?
Proposed owner: Physics and vacuum leads
Evidence or decision required: Gas choice, operating range, refill or sealed-life approach and supplier input.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What are the operating duration, duty cycle, warm-up, shutdown, heat and noise characteristics?
Proposed owner: Electrical and physics leads
Evidence or decision required: Test plan or defensible engineering estimate.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What RF exposure, magnetic-field, high-voltage, glass-breakage and thermal risks must be addressed?
Proposed owner: Safety owner to be assigned
Evidence or decision required: Hazard analysis with initial mitigations.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: Who may operate Product B, and may visitors interact with it directly?
Proposed owner: Product and safety owners
Evidence or decision required: Operator model, supervision requirement and interaction boundaries.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What installation, maintenance, expected lifetime, repair and warranty model is proposed?
Proposed owner: Operations lead
Evidence or decision required: Draft service concept and responsibilities.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: Which CE, EMC, low-voltage, machinery, pressure, glass, radio-frequency or other requirements may apply?
Proposed owner: Compliance owner to be assigned

Evidence or decision required: Initial regulatory mapping reviewed by a qualified specialist.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What are the realistic manufacturing and assembly times and long-lead components?
Proposed owner: Mechanical and electrical leads
Evidence or decision required: Supplier quotations and build sequence.
Deadline: 28 October 2026 team workday

6. Problem and approved evidence

Public understanding

Verified external fact: in a representative 2026 UK government survey of approximately 3,400 people, 65% had heard of fusion, but only 19% knew a fair amount or a lot and 5% said they knew a lot.
https://www.gov.uk/government/statistics/desnz-public-attitudes-tracker-spring-2026/desnz-public-attitudes-tracker-energy-infrastructure-and-energy-security-spring-2026-uk
Approved wording: awareness of fusion is broader than meaningful understanding. The survey shows an association between knowledge and support, not proof that education causes support.
Verified external fact: a UK–Japan–Canada regulatory working group stated that public knowledge about fusion is generally low and linked public acceptance to confidence in safety and regulation.
https://www.gov.uk/government/publications/agile-nations-uk-japan-and-canada-joint-recommendations-on-fusion-energy/agile-nations-working-group-on-fusion-energy-regulation-initial-recommendations
Approved wording: public engagement is one part of building informed confidence; it cannot replace credible regulation, safety, cost and performance.
Verified external fact: the United States and Japan identify public engagement as part of facilitating a social licence for fusion deployment.
https://www.energy.gov/articles/joint-statement-between-doe-and-japan-ministry-education-sports-science-and-technology

Access to facilities and education

Verified external fact: the IAEA counted almost 150 experimental fusion devices and testing facilities worldwide in 2025, including facilities planned or under construction.
https://conferences.iaea.org/event/392/attachments/16840/36163/FEC_2025___Programme___Conference_Material-final.pdf
Verified external fact: UNESCO reports more than 22,000 accredited and quality-assured higher-education institutions worldwide.
https://www.unesco.org/en/articles/transforming-higher-education-global-roadmap-future
Approved wording: research-grade infrastructure is concentrated relative to the global education system. This does not prove that every institution needs or would purchase Aurora equipment.

European ecosystem

Verified external fact: the European Commission says that a coherent EU-level approach is needed to support research, innovation, private engagement and cooperation between companies and publicly funded organisations.
https://energy.ec.europa.eu/topics/research-and-technology/fusion-energy-and-iter_en
Verified external fact: the Commission's planned fusion strategy includes workforce, private-sector participation, partnerships, funding, supply-chain, regulatory and governance considerations.
https://energy.ec.europa.eu/news/commission-launches-call-evidence-support-first-ever-eu-wide-fusion-strategy-2025-06-06_en
Approved wording: Europe recognises coordination, skills and commercialisation challenges. These findings do not prove demand for Product B.

Industry activity

Verified external fact: the Fusion Industry Association's 2026 survey covered 56 fusion companies and reported USD 14.24 billion in cumulative industry funding. These are industry-reported figures.
https://www.fusionindustryassociation.org/fusion-industry-attracts-record-annual-funding-of-4-48bn-raising-total-to-14-24bn/
Approved wording: fusion-sector investment and company activity create a relevant environment for education and outreach tools. They do not establish Product B purchasing intent.

7. Customer-segment playbooks

7.1 Science museums and science centres

Likely economic buyer: museum director, exhibition director, head of learning or procurement. Users: floor staff and educators. Beneficiaries: visitors, school groups and teachers.
Customer hypothesis: museums need visually compelling, reliable and scientifically responsible exhibits that can explain difficult concepts without constant specialist supervision.
Present alternatives: plasma globes, static models, videos, generic plasma exhibits and custom-built installations.

Product B fit: real visible plasma combined with a fusion-specific narrative and institutional presentation.

Likely objections: safety, uptime, maintenance, staff workload, visitor interaction, scientific accuracy, price and replacement parts.
Appropriate first offer: concept interview followed by a prototype review or co-design discussion.

Appropriate LOI: willingness to evaluate or host a prototype subject to safety, performance, price and budget.

[TEAM INPUT REQUIRED]
Question: Which 10 Nordic or European museums should be contacted first?
Proposed owner: Commercial team
Evidence or decision required: Named accounts, reason for fit, decision-maker role and warm-introduction path.
Deadline: 28 October 2026 team workday

7.2 Fusion companies, startups and laboratories

Likely economic buyer: communications, public affairs, partnerships, CEO office or laboratory leadership. Users: outreach staff, scientists and event teams.
Customer hypothesis: fusion organisations need a tangible object for events, investors, policymakers, recruitment and public communication.

Product B fit: a branded or configurable real-plasma demonstration. Product B must not be presented as proving the customer's reactor concept.

Likely objections: scientific oversimplification, brand fit, transport, reliability, safety and whether the exhibit accurately reflects the organisation's technology.

Appropriate first offer: co-design or event-demonstration partnership. Appropriate LOI: interest in evaluating a customised prototype or using it at a future event.

[TEAM INPUT REQUIRED]
Question: Which Product B features can be customised without redesigning the safety-critical system?
Proposed owner: Technical and commercial teams
Evidence or decision required: Approved customisation menu and cost implications.
Deadline: 28 October 2026 team workday

7.3 Universities and technical colleges

Likely economic buyer: department head, teaching laboratory manager, outreach office or grant holder. Users: lecturers, students and outreach staff.
Customer hypothesis: institutions want more tangible plasma teaching and recruitment experiences but may not need or afford a research-grade confinement device.
Product B fit: introductory demonstration, outreach and lobby or event exhibit. Product A may be a lower-cost classroom companion.

Likely objections: educational depth, curriculum relevance, price, safety, operator training and whether the device enables experiments or only visual demonstration.

Appropriate first offer: teaching-needs interview and curriculum co-design. Appropriate LOI: interest in evaluating a prototype for teaching or outreach subject to learning value and safety.

[TEAM INPUT REQUIRED]

Question: Which learning objectives will Product B support, and what can students actually observe or measure?
Proposed owner: Physics and education owners
Evidence or decision required: Draft learning outcomes, demonstration script and any proposed diagnostics.
Deadline: 28 October 2026 team workday

7.4 Energy companies, visitor centres and corporate innovation facilities

Likely economic buyer: visitor-experience, innovation, communications, sustainability or public-affairs lead.
Customer hypothesis: energy organisations need credible exhibits that explain emerging technologies and support stakeholder dialogue.
Product B fit: touring or permanent exhibit with transparent wording about fusion's uncertainty and development status.
Likely objections: reputational risk, relevance to company strategy, scientific neutrality, maintenance and sponsorship value.

Appropriate first offer: sponsored demonstration or visitor-centre pilot.

[TEAM INPUT REQUIRED]
Question: What sponsorship, rental and co-branding models will Aurora offer?
Proposed owner: Etienne
Evidence or decision required: Three commercial options with inclusions, exclusions and indicative pricing.
Deadline: 28 October 2026 team workday

7.5 Policy events, EU institutions and public exhibitions

Likely buyer or sponsor: event organiser, public-affairs organisation, fusion association, company consortium or institution hosting an exhibition.
Current signals: Erika Jangen of Novatron indicated potential relevance to a European fusion event and exhibition at the European Parliament in February 2027. Martin Søndergaard of Innovation Fund Denmark suggested possible funding pathways and a possible stellarator-model exhibition at the organisation's office. Both signals are non-binding, and the intended product configuration for Innovation Fund Denmark must be clarified.

Product B fit: high-impact, supervised real-plasma demonstration supported by factual explanatory material.

Likely objections: venue approval, transport, security, safety documentation, political neutrality and schedule certainty.

Appropriate first offer: requirements meeting and conditional event collaboration.

[TEAM INPUT REQUIRED]
Question: What would be required to demonstrate Product B safely in Brussels in February 2027?

Proposed owner: Etienne and technical/safety owners
Evidence or decision required: Venue requirements, transport, insurance, documentation, responsible operator and prototype readiness date.
Deadline: 28 October 2026 team workday

7.6 Upper-secondary schools

Product A is the more plausible direct-purchase product. Product B at DKK 149,995 is unlikely to fit an ordinary school budget without sponsorship, shared ownership, a grant or rental.

Potential Product B role: demonstration host, sponsored school event or shared regional resource.

Product A hypothesis: DKK 995 model plus DKK 495 curriculum bundle for physics, energy and magnetic-confinement teaching.

[TEAM INPUT REQUIRED]
Question: Which Danish upper-secondary curriculum outcomes can Product A and Product B legitimately support?
Proposed owner: Education owner to be assigned
Evidence or decision required: Curriculum mapping reviewed by teachers.
Deadline: 28 October 2026 team workday

7.7 Primary schools and younger learners

Primary schools are not currently a strong direct Product B market. Younger learners may be reached through museums, festivals, sponsored demonstrations and simplified teaching material.

Product A may be relevant mainly to older pupils, science clubs or specialised STEM programmes.

[TEAM INPUT REQUIRED]
Question: What minimum learner age and demonstration format are appropriate?
Proposed owner: Education and safety owners
Evidence or decision required: Teacher feedback and age-appropriate learning test.
Deadline: 28 October 2026 team workday

7.8 Private Product A buyers

Potential niche audiences: fusion professionals, physicists, engineers, students, science enthusiasts and scientific gift buyers.

Customer hypothesis: DKK 995 may be acceptable for a premium, accurate and well-packaged desk model, but not for a mass-market decorative item.

Validation route: limited preorder batch rather than a large production commitment.

[TEAM INPUT REQUIRED]
Question: What preorder threshold would justify a first Product A production batch?
Proposed owner: Etienne and Product A owner
Evidence or decision required: Minimum units, cash requirement, margin after VAT and acquisition cost.
Deadline: 28 October 2026 team workday

8. Six-slide pitch-deck briefs

Deck rule: approximately 70% shared factual core and 30% segment-specific content. Every deck must distinguish current capability from future design.

Museums and science centres

Slide 1: Why plasma and fusion are difficult for visitors to understand.
Slide 2: Product B - real visible plasma in a proposed institutional tabletop format.
Slide 3: Visitor, school-group and educator use cases.
Slide 4: Prototype status, operation, safety, maintenance and missing evidence.
Slide 5: Co-design or prototype-hosting proposal.
Slide 6: Request for a discovery meeting and conditional LOI.

[TEAM INPUT REQUIRED]
Question: Which museum-quality rendering, visitor journey and operating specification can be shown?
Proposed owner: Product and design owners
Evidence or decision required: Approved images and operating concept.
Deadline: 28 October 2026 team workday

Fusion companies and laboratories

Slide 1: The challenge of making a complex reactor programme tangible to non-specialists.
Slide 2: Product B and its limits — an outreach system, not proof of reactor performance.
Slide 3: Events, recruitment, investor, policymaker and public-engagement use cases.
Slide 4: Customisation boundaries, reliability and safe operation.
Slide 5: Co-design or branded demonstration proposal.
Slide 6: Request for requirements discussion and conditional LOI.

Universities and technical colleges

Slide 1: Limited hands-on exposure and abstract introductory teaching.
Slide 2: Product B as a visible plasma demonstration; Product A as a static companion.
Slide 3: Teaching, recruitment and outreach use cases.
Slide 4: Learning objectives, diagnostics, safety and operator training.
Slide 5: Curriculum co-design or prototype-evaluation proposal.
Slide 6: Request for faculty interview and conditional LOI.

Energy organisations and visitor centres

Slide 1: Explaining emerging energy technologies credibly to visitors and stakeholders.

Slide 2: Product B as a real-plasma engagement exhibit.
Slide 3: Visitor-centre, innovation-day and touring-event use cases.
Slide 4: Neutral content, installation, safety and maintenance.
Slide 5: Sponsored pilot, rental or permanent-installation options.
Slide 6: Request for a scoping meeting.

Policy and European public-engagement events

Slide 1: Low meaningful understanding of fusion despite growing policy attention.
Slide 2: Product B as a supervised conversation starter using real plasma.
Slide 3: Event and stakeholder-engagement use case.
Slide 4: Venue, safety, operator, transport and documentation requirements.
Slide 5: Conditional event partnership proposal.
Slide 6: Requirements meeting and written expression of interest.

Question: Who approves each deck before external use?
Etienne

9. Outreach email playbook

Common message structure

Subject: specific to the recipient's role, current programme or exhibition.

Opening relevance: demonstrate why Aurora selected this organisation.

Problem: use the customer's language, not the full fusion-industry problem.

Product explanation: one concise paragraph explaining Product B and its present status.

Credibility: team capability and relevant market signal without overstating traction.

Request: 20–30 minute discovery call, prototype-requirements discussion or co-design conversation.

LOI step: ask only after fit and conditions are discussed.

Claims permitted

- Product B is a proposed table-sized real-plasma exhibition and educational system.
- Aurora is validating technical requirements, safety, customer need and pricing.
- The team includes physics, electrical and mechanical engineering capabilities.
- Aurora received non-binding interest signals at Nordic Fusion Forum 2026.

Claims prohibited until validated

- Product B is maintenance-free, zero-risk, certified or ready for delivery.
- Product B proves plasma-confinement mastery or commercial fusion viability.

- Aurora has customers, contracts or LOIs when it only has expressions of interest.
- One exhibit creates public confidence or measurable emissions reductions.
- The target price and gross margin are validated.

Question: What tone should Aurora use in outreach: technical, visionary, educational or commercial?
A combination of **technical, visionary, educational or commercial,** but tailor each outreach situation to who we want to reach at that time.

10. Pilot and validation offers

Customer discovery interview

Aurora provides: structured interview, concept summary and follow-up synthesis. Partner provides: 30–45 minutes and honest feedback. Output: documented problem, current alternative, requirements, budget and decision process.

Concept-validation partner

Aurora provides: early design review and requirements workshop. Partner provides: named subject-matter and operational contacts. Output: prioritised requirements and written feedback.

Prototype demonstration host

Aurora provides: supervised prototype demonstration when technically ready. Partner provides: venue, audience, operating feedback and safety coordination. Output: demonstration report and evidence of user response.

Museum or curriculum co-design partner

Aurora provides: concept, prototype access and draft content. Partner provides: educational, visitor-experience or curriculum expertise. Output: validated learning and exhibition requirements.

Sponsored exhibition partner

Aurora provides: exhibit concept and delivery plan. Partner provides: funding, venue or event access. Output: public demonstration subject to technical and safety readiness.

Conditional pilot customer

Aurora provides: defined pilot specification. Partner provides: conditional intent to test, rent or purchase if agreed requirements are met. Output: specific non-binding LOI.

Rental or event partner

Aurora provides: supervised short-term installation. Partner provides: fee, venue, logistics and event requirements. Output: a repeatable rental model.

Question: Which two pilot offers will Aurora prioritise first?
Product B exhibition stellerator with real plasma and magnetic field shaping, then Product A FDM print as a bonus - but not included in funding budget ask in seeding round (first 100k dkk).

11. LOI strategy and internal template

An LOI should be non-binding but specific. It should demonstrate an identifiable use case, conditions and a credible next step rather than general enthusiasm.

Required LOI fields

- Institution, contact and authorised signatory.
- Intended Product B use case.
- Reason for interest.
- Willingness to review, host or evaluate a prototype.
- Potential purchase, rental, sponsorship or pilot interest.
- Indicative price range if discussable.
- Safety, performance, budget and procurement conditions.
- Proposed validation activities.
- Expected decision timeline.
- Explicit non-binding status.

Internal draft — requires review before external use

To whom it may concern:
[Institution] confirms its non-binding interest in evaluating Aurora Confinement's proposed Product B real-plasma exhibition and educational system for [intended use].
Subject to satisfactory technical performance, safety documentation, operating requirements, price, internal budget approval and procurement procedures, [Institution] would be interested in [reviewing / hosting / piloting / renting / considering purchase of] the system.
The parties intend to explore [specific validation activities] during [time period]. This letter does not create a purchase obligation, exclusivity, financial commitment or legal partnership.
Name, role, organisation, date and signature:
Internal note: obtain legal review before standardising or externally relying on this template.

Question: Who will approve LOI wording and maintain signed files?
Etienne

12. Team and execution capability

Aurora-supplied team structure: 12 engineering and physics contributors, described as 5 core members and 7 extended members: 9 physics, 2 electrical and 1 mechanical engineering profiles.

Core team

- Etienne Rasmus Gras — Mechanical Engineering; commercial lead, operations and project coordination.
- Malik Zaabalawi — Physics Engineering; technology, sales, theory and freedom-to-operate research.
- Stig Kvistgaard Jensen — Physics Engineering; COMSOL, modelling, programming and core technology.
- Tobias Peter Elholm — Physics Engineering; plasma parameters, machine requirements and market validation.
- Robin William Brandt — Physics Engineering; core physics, concept development and exhibition models.

Extended team

- Fie London — Electrical Engineering.
- Simon Allermann Møller — Electrical Engineering.
- Elisabeth Astrup Christensen — Physics Engineering; Aurora describes her as the team's most experienced engineer. Aurora-supplied materials show work on collective Thomson scattering diagnostic feasibility and performance for the JT-60SA fusion experiment, plus a part-time Analysis Assistant role at SUBRA A/S. Aurora believes she may currently be working at EPFL on stellarator research; the current affiliation and exact role require direct confirmation before external use.
- Emily Bak Torp — Physics Engineering.
- Elias Lindegaard Andersen — Physics Engineering.
- Tobias Sejling Tops — Physics Engineering.
- Frederik Bjerre Dansbo — Physics Engineering.

Informal academic advisers

The supplied team material names Søren Bang Korsholm and Timothy John Booth as informal academic advisers. Adviser status, actual commitment and permission to use their names externally must be confirmed before inclusion in applications or customer decks.

Prospective team members

Manon Johansson Chatel is recorded as a prospective member, not a confirmed team member. The supplied profile screenshot shows experience in risk and model validation at Danske Bank, gravitational-wave research at NBI and an MSc in Quantum Physics. No additional qualifications or commitment are inferred.

Question: What role, availability, commitment and responsibilities would Manon have?

We don’t know yet, but she is good at governance, and actually does it professionally right now. She might be able to help with physics modelling.

Jakob Julius Douglas Bang is recorded as a prospective member, not a confirmed team member. Aurora reports that he is pursuing a BSc in Data Science and Management. The supplied profile screenshot identifies him as a DTU student and Student Assistant in Commercial Excellence at BioCirc. Potential contribution areas to explore include commercial analysis, market and lead data, customer-relationship processes and internal dashboards; no role, availability or commitment is inferred.

Question: What role, availability, commitment and responsibilities would Jakob have?
Helping with operations and perhaps some data management / science.

Question: For every contributor, what are the formal role, weekly hours, three-month deliverables, compensation or ownership expectations, IP assignment and permission to be named externally?
We haven’t established that yet. Will be done when CVR application is filled out and we get accepted into DTU Skylab.

Question: Who is accountable for Product B technical delivery, electrical safety, mechanical integration, plasma physics and commercial validation?
Core team
Evidence or decision required: Named accountable owner for each workstream.

13. Founder and commercial credibility

Aurora-supplied fact: Etienne Rasmus Gras has approximately 10 months of experience operating a Danish ApS as co-founder of Nordicorp ApS.
Aurora-supplied fact: Etienne is board member, treasurer and business lead at DTU RAVEN, described as a DTU Blue Dot team, with responsibilities relating to funding, accounting, budgets, business development and engineering coordination.
Aurora role: commercial lead, operations and project coordination.
Approved interpretation: this is early operating and financial-management experience. It must not be presented as extensive executive experience.

[TEAM INPUT REQUIRED]
Question: Which Nordicorp results may be disclosed: revenue, customers, delivered projects, funding or operational milestones?
Proposed owner: Etienne
Evidence or decision required: Verified figures and permission to disclose.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What funding, budget and project results from DTU RAVEN may be referenced externally?
Proposed owner: Etienne

Evidence or decision required: Approved evidence and any required organisational consent.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What is Etienne's weekly availability and formal founder commitment to Aurora?
Proposed owner: Etienne
Evidence or decision required: Written commitment and competing-obligations review.
Deadline: 28 October 2026 team workday

14. Early traction and market signals

The following are non-binding expressions of interest submitted around Nordic Fusion Forum 2026. They are not LOIs, customers, contracts or validated revenue.

- Matthew Lawson, Savantic — research collaboration; indicated timeframe of one to three years.
- Max Grünwald, Delphinus — investment partnership; indicated interest as soon as available.
- Jonas Måhlén, Novatron Fusion Group — research-platform interest; exploring future opportunities.
- Erika Jangen, Novatron — EU Senior Policy Advisor on Energy Technology; interest in both product directions; within 12 months; potential relevance to a European fusion event and exhibition at the European Parliament in February 2027.
- Martin Søndergaard, Innovation Fund Denmark — Head of Grand Solutions; non-binding investment-partnership interest within 12 months; suggested possible funding routes for edtech or development and a possible stellarator-model exhibition at Innovation Fund Denmark's office. The intended Aurora product configuration remains to be clarified.

Interpretation: Martin Søndergaard's submission is the strongest combined funding-pathway and institutional exhibition-use-case signal, but it does not yet specify which Aurora product configuration is intended. Erika Jangen's submission remains a clear Product B public-engagement opportunity. The other submissions indicate broader research, investment or partnership interest. All five signals are non-binding and require follow-up before becoming a pilot, partnership, funding application or LOI.

Follow-up status

Matthew Lawson / Savantic — owner: unassigned. Next action: clarify the research-collaboration problem and whether it relates to Product B or a future platform.

Max Grünwald / Delphinus — owner: Etienne proposed. Next action: clarify investment mandate, timing and evidence required.
Jonas Måhlén / Novatron — owner: unassigned. Next action: clarify whether interest is exclusively in a research platform and whether Product B has outreach relevance.

Erika Jangen / Novatron — owner: Etienne proposed. Next action: request a requirements call for the February 2027 European Parliament event, including venue, safety and timing.

Martin Søndergaard / Innovation Fund Denmark — owner: Etienne proposed. Next action: thank him, request a meeting to identify applicable funding instruments and requirements, and clarify whether the office exhibition use case concerns Product A, Product B or another configuration.
[TEAM INPUT REQUIRED]
Question: What follow-up dates and owners will be assigned to all five signals?
Proposed owner: Etienne
Evidence or decision required: Outreach tracker updated with dates, outcomes and next actions.
Deadline: 28 October 2026 team workday

Public exposure

Existing public exposure includes Aurora mentions and event photographs on LinkedIn. Visibility is supporting credibility, not customer validation.
https://www.linkedin.com/feed/update/urn:li:activity:7518619533817868288/
https://www.linkedin.com/posts/nordic-fusion-forum-2026-and-lunch-lecture-ugcPost-7520749011922743296-R62n/?utm_source=share&utm_medium=member_desktop&rcm=ACoAADqqKuAB0mJMp8CN96CgDD8RJZdWqXB-trk

auroraconfinement.com

15. Market, pricing and business model

Internal planning estimate: conservative lower-bound global Product B hardware TAM of approximately DKK 111.15 million based on 741 assumed qualified candidate accounts at DKK 149,995 each.
Internal planning estimate: initial European Product B SAM of approximately DKK 8.70 million based on 58 assumed serviceable accounts.
Internal planning scenarios: conservative SOM of 2 paid units within three years and 6 within five years; base SOM of 5 within three years and 15 within five years; ambitious SOM of 10 within three years and 30 within five years.
These are assumption-led planning estimates, not forecasts or validated demand.
Market anchors: ASTC describes nearly 600 members including more than 475 science-centre and museum peers.
https://www.astc.org/wp-content/uploads/2025/08/ASTC-SCM-Small-Museum-Membership-One-Page-Document.pdf
Market anchor: Ecsite states that it has more than 300 member organisations.
https://ecsite.eu/ABOUT-Ecsite

[TEAM INPUT REQUIRED]
Question: Does the DKK 149,995 price include or exclude VAT, installation, travel and training?
Proposed owner: Etienne
Evidence or decision required: Approved price sheet with inclusions and exclusions.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What supplier quotations support the DKK 56,500 estimate?
Proposed owner: Product B build owner
Evidence or decision required: Current quotations with date and supplier.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: What are the certification, warranty, service, installation, sales and travel costs?
Proposed owner: Etienne and technical owners
Evidence or decision required: Cost model with assumptions.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]
Question: Which recurring models will be tested: maintenance, training, curriculum, content, rental, sponsorship or warranty extension?
Proposed owner: Commercial team
Evidence or decision required: Two priority models and price hypotheses.
Deadline: 28 October 2026 team workday

16. Competition and alternatives

Do not claim that Aurora has no competition. Customers may solve the communication or education problem with plasma globes, static models, museum-built plasma exhibits, university demonstrations, videos, simulations, virtual reality, custom exhibition agencies or commercial plasma teaching equipment.

Comparison criteria

- Real visible plasma.
- Fusion-specific narrative.
- Scientific relevance.
- Portability.
- Safety and supervision.
- Maintenance and expected uptime.
- Visitor or student interactivity.
- Educational content.
- Customisation.
- Purchase, rental and lifecycle price.

[TEAM INPUT REQUIRED]
Question: Which named products and suppliers should be used in the verified competitor comparison?
Proposed owner: Freedom-to-operate and commercial owners
Evidence or decision required: Named alternatives with links, specifications, prices and claim-safe comparison.
Deadline: 28 October 2026 team workday

[TEAM INPUT REQUIRED]

Question: What is Product B’s defensible differentiation if customers can commission a custom exhibit?
Proposed owner: Core team
Evidence or decision required: One evidence-based differentiation statement.
Deadline: 28 October 2026 team workday

17. Development roadmap and DKK 100,000 use of funds

Draft allocation for team confirmation:

- DKK 55,000 — prototype components, enclosure and assembly.
- DKK 15,000 — safety, electrical requirements, documentation and specialist input.
- DKK 10,000 — demonstrations, travel and institutional testing.
- DKK 5,000 — company establishment and essential administration.
- DKK 5,000 — technical materials and preparation of the subsequent application.
- DKK 10,000 — contingency.

The DKK 100,000 round is not presented as sufficient for full certification, mass production, international scaling or Product C.

Stage gates

1. Concept frozen — approved requirements and scope.
2. Supplier and BOM validation — quotations and lead times.
3. Subsystem testing — vessel, RF, electronics, magnetic components and controls.
4. First integrated prototype — defined plasma and reliability milestone.
5. Safety review — documented hazards and mitigations.
6. Internal demonstration — repeatable operating procedure.
7. External customer demonstrations — structured feedback.
8. LOIs or pilot discussions — specific conditional interest.
9. Company establishment — confirmed legal and ownership structure.
10. Innobooster readiness — application evidence package complete.

Long-term Product C research-platform roadmap — draft engineering hypothesis

Product C is Aurora Confinement’s longer-term research-platform ambition. This roadmap is a preliminary engineering and funding hypothesis, not a current delivery commitment, sales forecast or part of the initial DKK 100,000 Product B pre-seed scope.
All timing, budgets, technical configurations, prices and commercial outcomes below require team, supplier, safety and customer validation. Product C must not be sold or promised for delivery before the relevant technical and safety stage gates are closed.

Phase 1: Design, requirements and procurement planning (Months 1–3)

- Freeze Product C user requirements, performance hypotheses and system boundaries.
- Complete baseline CAD for the vacuum chamber, magnetic coils and structural supports.
- Advance the Product C bill of materials and obtain an initial supplier-quotation plan.

- Produce a preliminary hazard and safety review covering vacuum, magnetic, electrical, thermal, gas and microwave systems.

Stage-gate outcome: approved baseline Product C design, preliminary hazard map and costed procurement plan.

Phase 2: Core hardware, vacuum and magnetic systems (Months 4–7)

- Procure and assemble the vacuum vessel, pumps, gauges, flanges and feedthroughs.
- Procure and assemble magnets, conductors, supports and cooling equipment.
- Establish the baseline data-acquisition architecture, digitizer and control computer.
- Conduct research-customer discovery and prepare grant-support material without representing Product C as validated or ready for delivery.

Stage-gate outcome: assembled Product C vacuum and magnetic chassis with operational baseline data acquisition and documented subsystem tests.

Phase 2.5: Subsystem validation (Months 8–9)

- Perform vacuum leak testing against a defined baseline-pressure requirement.
- Map the magnetic field using automated Hall-probe measurements.
- Compare measured fields with the Phase 1 COMSOL model and document deviations, tolerances and corrective actions.

Stage-gate outcome: vacuum and magnetic acceptance criteria met, with unresolved discrepancies and required redesigns documented.

Phase 3: Plasma generation, heating and initial diagnostics (Months 10–11)

- Install controlled gas handling, regulators and mass-flow controllers.
- Integrate the proposed 2.45 GHz electron-cyclotron-resonance-heating system only after a dedicated engineering and safety review.
- Deploy initial diagnostics, including Langmuir probes and optical-emission spectroscopy.

Stage-gate outcome: controlled plasma generation and a documented capability to measure initial electron-density and temperature indicators.

Phase 4: First-plasma validation, optimisation and commercial preparation (Months 12–18+)

- Characterise confinement behaviour, radiation losses and magnetic-field errors.
- Optimise coil shimming and operating parameters against defined performance criteria.
- Publish or share performance data only after technical review and with clear limitations.
- Begin research-customer beta, grant and conditional-purchase discussions after repeatable performance and safety evidence exist.
- Prepare the next funding round using validated results, supplier data and customer evidence rather than assumed Product B revenue.

Stage-gate outcome: repeatable Product C performance data, documented limitations, a reviewed safety case, a beta specification and evidence-based purchasing or research-partnership interest.

Product C preliminary capital framework

- Vacuum-system infrastructure: DKK 400,000–800,000.
- Magnetic-confinement system: DKK 500,000–1,200,000.
- Plasma heating and gas handling: DKK 150,000–400,000.

- Diagnostics and data acquisition: DKK 300,000–800,000.
- Software, assembly, safety equipment and contingency: DKK 350,000–600,000.

Preliminary Product C roll-up: DKK 1.7–3.8 million. This is an engineering estimate based on an unvalidated component framework, not a supplier-backed budget or investor commitment.
Budget reconciliation required: the source roadmap's phase-level budgets total approximately DKK 880,000–3.44 million, mix work on Products A, B and C, and do not allocate a separate amount to Phase 2.5. They must not be presented as a Product C budget until the team reconciles them with the bottom-up Product C estimate.
The team must confirm whether labour, facilities, insurance, certification, installation, freight, VAT, maintenance and customer support are included in each estimate.

Product C go/no-go requirements

- Approved research use case, customer requirements and measurable technical performance criteria.
- Named technical, safety, procurement and commercial owners with confirmed availability.
- Preliminary facility, safety, compliance and operating plan.
- Supplier quotations and credible component lead times.
- Documented demand evidence from prospective research customers and academic partners.
- A funding plan that does not depend on unproven Product B sales or unconfirmed Product C purchase orders.

Relationship to Product B: Product B remains Aurora's immediate pre-seed focus. Product B may help Aurora build practical experience, institutional relationships and future revenue, but Product C must be evaluated and funded through its own technical, safety, customer and capital stage gates.

[TEAM INPUT REQUIRED]
Question: Who owns each stage gate, what evidence closes it, and what is the deadline?
Proposed owner: Etienne and workstream owners
Evidence or decision required: Completed roadmap with owner, budget, evidence and completion criterion.
Deadline: 28 October 2026 team workday

18. Climate impact and Sustainable Development Goals

Aurora does not generate fusion electricity, and Product C cannot presently be assigned direct avoided greenhouse-gas emissions. Its credible near-term impact is educational and enabling.
Verified external fact: the European Nuclear Safety Regulators Group states that fusion power would produce no carbon dioxide during operation, while also stressing the technical difficulty of sustained fusion and ITER's experimental role.
https://nuclear-safety-regulators.ec.europa.eu/topics/fusion-energy_en
Verified external fact: ITER explains that fusion systems can still generate activated materials requiring controlled handling and waste management.

https://www.iter.org/faqs?thematic=77
The United Nations defines SDG 4 around quality education, SDG 7 around affordable and clean energy, SDG 9 around infrastructure and innovation, SDG 13 around climate action and SDG 17 around partnerships.
https://sdgs.un.org/goals
Conservative mapping: SDG 4 through plasma education; SDG 7 through engagement with a potential future low-carbon technology; SDG 9 through development of scientific demonstration equipment; SDG 13 through accurate climate and energy education; SDG 17 through institutional partnerships.

Environmental indicators to establish

- Electricity consumption per demonstration hour.
- Embodied materials and estimated emissions.
- Product lifetime, repairability and upgradeability.
- Packaging and transport.
- Consumables and end-of-life recovery.

Education and engagement indicators to establish

- Institutions using Product B.
- Demonstrations delivered.
- Students and visitors reached.
- Teaching hours enabled.
- Measured learning outcomes.

[TEAM INPUT REQUIRED]
Question: Which impact indicators can realistically be measured during the first prototype pilots?
Proposed owner: Impact owner to be assigned
Evidence or decision required: Short measurement plan with baseline and method.
Deadline: 28 October 2026 team workday

19. Risk and assumption register

Priority risks

- Prototype feasibility and stable visible-plasma performance.
- Glass-vessel supply and breakage.
- RF, high-voltage, electrical, magnetic-field and thermal safety.
- Certification and venue approval.
- Reliability, maintenance and service burden.
- Institutional willingness to pay.
- Long procurement cycles.
- Team availability and accountable ownership.
- IP ownership and contributor agreements.
- Permission to name advisers externally.
- Manufacturing and support capacity.

- Liability and insurance.
- Dependency on grant funding.
- Public-communication and overclaiming risk.

[TEAM INPUT REQUIRED]
Question: For every priority risk, what are probability, impact, mitigation, owner and evidence required?
Proposed owner: Team
Evidence or decision required: Completed risk register reviewed at the next project meeting.
Deadline: 28 October 2026 team workday

20. Assets and evidence library

Known assets

- Principal context document in Google Docs.
- Aurora website and LinkedIn company page.
- Team overview graphic.
- Nordic Fusion Forum 2026 photographs and form submissions.
- Product A, Product B and Product C preliminary BOM and pricing estimates.
- Public-source links supporting the problem and market anchors.

Assets to locate or create

- Product B sketches, CAD, system diagram and renderings.
- Subsystem and prototype photographs or videos.
- Product A photographs and print files.
- Approved team photograph and individual biographies.
- Logo files and brand guidelines.
- Supplier quotations.
- Interview notes and outreach tracker.
- Signed LOIs and pilot documents.

[TEAM INPUT REQUIRED]
Question: Where will Aurora store canonical assets, and who controls external-use permissions?
Proposed owner: Etienne
Evidence or decision required: Folder structure, owner and permission rules.
Deadline: 28 October 2026 team workday

21. Private outreach pipeline

Restricted internal appendix. Do not copy into shared decks, funding documents or external AI prompts without a legitimate need.
Store contact details separately from the main narrative. Track institution, role, lawful contact source, outreach owner, last contact, status, objection, next action, target date and LOI probability.

[TEAM INPUT REQUIRED]
Question: Which shared system will hold contact details and follow-up status?
Proposed owner: Etienne
Evidence or decision required: Approved CRM, spreadsheet or restricted document.
Deadline: 28 October 2026 team workday

22. Final workshop checklist

Decisions to make during the workday

- Confirm Product A, B and C definitions and priorities.
- State exactly what Product B hardware exists today.
- Define the minimum viable Product B prototype.
- Assign accountable technical, safety and commercial owners.
- Choose the first three customer segments.
- Choose the first two pilot offers.
- Approve the initial LOI request.
- Confirm the DKK 100,000 use of funds.
- Assign follow-up for all five Nordic Fusion Forum signals.
- Set the next review date.

Information to collect after the workday

- Supplier quotations and manufacturing lead times.
- Initial compliance and hazard assessment.
- Customer interviews and willingness-to-pay evidence.
- Named competitor research.
- Curriculum and learning-outcome mapping.
- Team commitment, IP and external-name permissions.
- Named 30-account outreach list.

Readiness condition for customer-specific emails and decks

Aurora is ready to generate targeted emails and six-slide decks when the relevant segment playbook has a named buyer, use case, approved claims, current product status, clear meeting request, pilot concept and explicit list of unknowns.

Readiness condition for LOI outreach

Aurora is ready to request LOIs when the recipient has discussed a real use case and the proposed letter records specific conditions, validation activity and a credible decision path.

Ten questions the team must answer first

1. What exactly exists physically for Product B today?
2. What is the minimum prototype that DKK 100,000 can complete?
3. Which safety and compliance questions could block a public demonstration?
4. Who is technically accountable for delivering Product B?

5. Which three customer segments will Aurora prioritise first?
6. What pilot or partnership is Aurora actually offering each segment?
7. What evidence would make a prospective partner sign a conditional LOI?
8. Which 30 named accounts will be contacted, by whom and by when?
9. What commitments, availability, IP arrangements and external-use permissions apply to each team member and adviser?
10. Which assumptions must be validated before the DKK 100,000 application is submitted?
